Where your agent payment records live.

And how long they stay there.

Six answers a bank's due-diligence team will ask for, taken from our public docs.

Five kinds of record.

Events	Stored as received, with your signature. Append-only.
Evidence	Mandates, receipts and other network proofs, as received.
Derived	Verification results, mandate evaluations, screenings, alerts, cases.
Audit log	Every write, and every view of evidence or a pack.
Packs	Signed zip files in locked object storage.

Three things to keep out of an event.

Card numbers	Rejected on ingest with pan_detected.
Instruction text	Send its hash, and optionally a redacted summary.
EU and UK personal data	We're US-only for now. The event is still accepted, with the warning eu_owner_country.

One region: AWS us-east-1.

Database	Amazon RDS
API, worker, dashboard	Amazon ECS on Fargate
Evidence packs	Amazon S3
Email	Amazon SES, us-east-1
Error monitoring	Sentry, US region

A correction is a new event.

Events and verification results are append-only. Nobody edits or removes them, including us.

Daily hash-chain anchors are kept with the data they cover, so a reviewer can tell if anything was changed after the fact.

7 years

Evidence packs sit under a seven-year retention lock.

Nobody can shorten it, including HalvorAI.

Sandbox data is different: it's purged after 30 days, and sandbox packs carry a watermark so they can't pass for production evidence.

Every view is logged.

Your team	Evidence values are shown only to analysts and above. Each view goes in the audit log.
Your bank	No account needed. A share link opens one pack, expires within 30 days, can be revoked, and logs each view.

Ask us where your data lives before your bank does.

We record and verify agent payments, and sit outside the payment path. HalvorAI is in developer preview.
