OCC BULLETIN 2026-54 · 4 NOV 2026

The OCC on agents that pay.

What its new examiner framework asks about, and which of it is a question about records.

FIRST, WHAT IT IS

A guide for examiners. It sets no new expectations.

> “This supervisory framework does not establish supervisory expectations for banks.”
>
> OCC Bulletin 2026-54

It still shows how examiners will read AI that acts, including agents that pay. "SI" is the framework’s term for AI.

RISK FOLLOWS THE ACTION

“A highly autonomous payment agent may present greater SI risk than an SI agent only used for internal drafting.”

Framework, section 2.2

FACTORS IT LISTS INCLUDE

- decision consequence
- reversibility
- customer and financial impact
- autonomy
- data sensitivity

FOR AGENTS A BANK DOESN’T CONTROL

Seven things a bank may look at.

01 Identity

02 Provenance

03 Delegation

04 Authentication

05 Monitoring

06 Velocity limits

07 Dispute handling

Framework, section 2.10, on external agents such as agentic-commerce systems.

MOST OF IT IS A QUESTION ABOUT RECORDS

What a record can answer.

Identity

The agent and the owner it acted for, on every event.

Delegation

The mandate that came with the payment, checked: within, outside or not_evaluable.

Authentication

Network proofs verified as received: AP2, Verifiable Intent, Visa TAP.

Monitoring

Detectors with documented thresholds, such as loop and velocity_spike. They report.

Traceability

Instruction hash and tool_call_id, tied to the payment id.

A LIMIT WORTH STATING

Kill switches and rate limits stay with you.

HalvorAI sits outside the payment path. It records and verifies agent payments and raises alerts. It doesn’t stop or delay a payment.

Circuit breakers, velocity limits and suspension belong to your own controls and your networks. A record helps you show they worked.

FOR BANK AND FINTECH RISK TEAMS

Which of the seven do you ask agent-payment partners about today?

Our reading of a public framework, not legal advice.
