SECURITY, STATED PLAINLY

What we can say about our security today. And what we can’t.

TENANT ISOLATION

Each organization’s data is walled off in the database.

PostgreSQL row-level security, set from the authenticated key or session on every transaction. A query without one is refused. Tests check that one organization’s key gets a 404 for another’s ids, on every route.

TRUE TODAY

KEYS

API keys are stored only as a SHA-256 hash.

Revoking a key takes effect within 30 seconds. Source keys are Ed25519 keys generated on your machine, and we store only the public half.

TRUE TODAY

RECORDS

Every write, and every view of evidence, is logged.

Internal staff access to customer data needs a ticket and appears in the audit log your organization can see. Pack signing keys rotate by adding a new key id, and old public keys stay published so old packs keep verifying.

TRUE TODAY

ASSURANCE

We don’t hold a SOC 2 report.

We’re preparing for the audit. Please don’t describe us as certified. A security questionnaire, SIG Lite or CAIQ, is available on request.

◐ NOT YET

RESIDENCY AND SCOPE

We’re US-only for now.

Storage and compute run in AWS us-east-1. We don’t accept personal data of EU or UK data subjects. TLS 1.2 or later in transit, AES-256 at rest.

◐ NOT YET

FOR SECURITY REVIEWERS

What’s the first thing you ask a vendor at this stage?

HalvorAI is in developer preview with early-access partners. The full overview is in our docs.
