HalvorAI

FIRST PAYMENT, NEW X402 WALLETS

73 days to 18 minutes

What a wallet with no history means for risk teams.

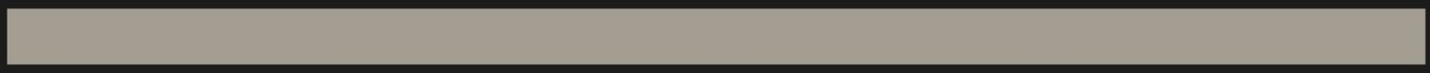

HalvorAI

THE MEASURE

Time from a wallet's seed funding to its first x402 spend.

Late 2025, median — 73 days

Q3 2026 — 18 minutes

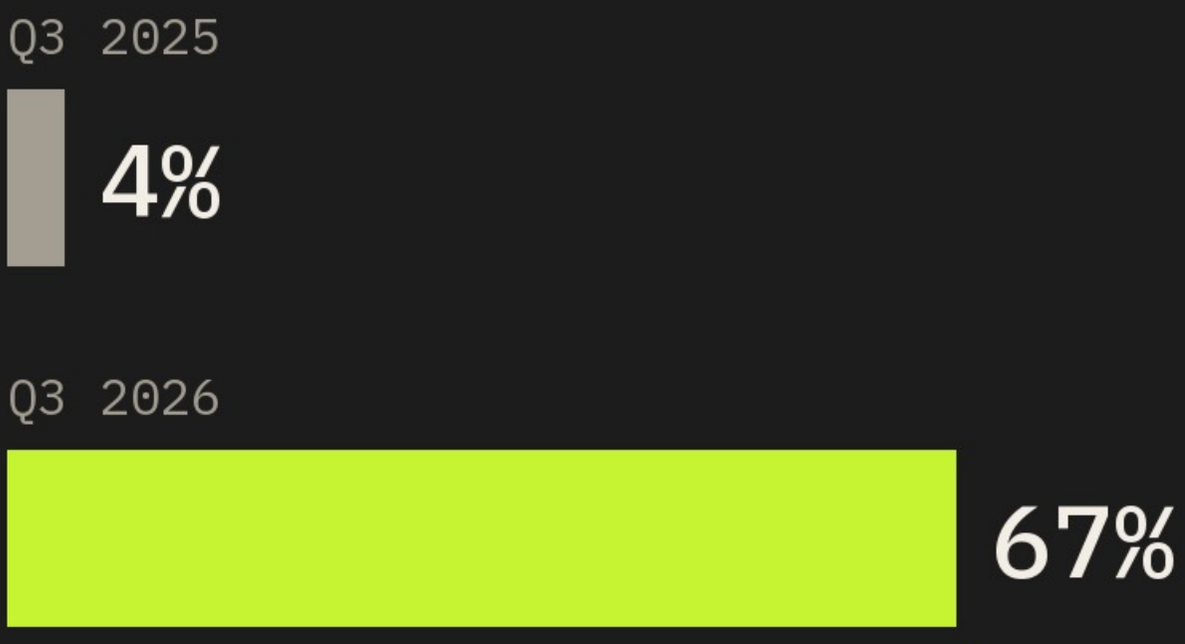

The 18-minute bar is enlarged so it can be seen. At true scale it would be under a pixel.

HalvorAI

SHARE OF NEW WALLETS

First payment within an hour of funding.

Roughly two in three new wallets now spend almost straight after being topped up.

READ THE FIGURES WITH CARE

What the report does and doesn't say.

138 million

x402 transactions on Base by the end of the 12 months to 1 July 2026. A cumulative count.

Over 87%

of x402 payments were between a hundredth of a cent and a dime, in the 16 months to September 2026.

Not stated

How the wallets were identified as agents. The report doesn't describe the method.

Source: Chainalysis, Oct 2026

OUR READ

Wallet age used to come free. Now there may be nothing to read.

A long-lived wallet leaves a track record before it does anything new. A wallet that pays 18 minutes after funding doesn't.

So it helps to split the checks in two: the ones that judge a payment on its own, and the ones that need a past.

HalvorAI

IN HALVORAI, DEVELOPER PREVIEW

Two kinds of check.

Works from payment one

Payee sanctions screening. Proof verification. Comparing a payment with its signed mandate.

Needs a past

Baselines use 30 days of an agent's events. With fewer than 20 events it is still learning, so only the rule-based detectors fire. Scope drift can't fire at all without an established past.

That second list is a real gap in an agent's first payments. We'd rather state it.

HalvorAI

What do you look at on an agent's first day?

We record and verify agent payments after they happen, and raise alerts. We're outside the payment path.

HalvorAI is in developer preview.
