

Nine payments. Two merchants. One approved budget.

What should the record show afterwards?

20 October, Cloudflare Connect.

Agent Pay for Machines builds on x402 and connects it to the Mastercard network. In the demo, an agent bought digital services for a business within an approved budget and permissions.

Mastercard is opening Early Access to developers.

The flow, as Mastercard describes it

402	The service answers Payment Required.
Sign	The agent signs a payment voucher within its limit.
Verify	The seller verifies it and the work continues.
Redeem	Vouchers can be combined and redeemed later.

A voucher proves it was signed. It won't explain why.

- Which agent signed it?
- Who was it acting for?
- What task was it given?
- Which budget did it draw on?
- Did all nine stay inside it?

One event per step, tied to one payment.

agent, owner
who paid and who for

Our docs cover x402 v2 today.

They don't yet list Agent Pay for Machines, so treat this as how we think about the record, not a shipped integration.

A mandate is evidence of authority. We report whether a payment stayed within it. We don't enforce it, and we sit outside the payment path.

Where does your record of an agent's budget live?

We're in developer preview with early-access partners.
